"SILA"
Serbian Industry Light Aircraft

AEE & ITS TEAM:

The tradition of aeronautical engineering lives in our technicians, professionals and handy-craftsmen, as most of them come from the aeronautical military school.

What differentiates us as a company today is the team spirit, combined with tradition. We are that company, which is able to generate AEC fittings to the market of the future – the one that would expect professional, quality light aircraft, conforming to the highest standards.

All this is made possible thanks to our cooperation with the Mechanical Engineering Faculty of Kraljevo, as well as with the Aeronautical Engineering Faculty of Belgrade. It also enables the high quality realization of the products MXP licensed by Aeromarine, as well as the new design of the line of products, SILA, to be completely drawn and realized in Serbia. SILA, gamma designed by the Faculty of Aeronautical Engineering of Belgrade. We belong to the VLA Category starting from the lightest of 472.5 (which is possible to identify also as ULM) up to the heaviest models of 750kg.
